

**SECURITY FONT SYSTEM  
AND METHOD FOR GENERATING  
TRACEABLE PAGES IN AN ELECTRONIC DOCUMENT**

5

**ABSTRACT OF THE INVENTION**

A security font system and method are provided for generating traceable pages in an electronic document. The method comprises: accepting an electronic document; modifying font print instructions associated with selected characters; and, transmitting the document with the modified font print instructions to a destination. In some aspects, the method further comprises saving a record of the modified font print instructions. The font print instructions can be modified clandestinely. If a printed copy of the document with modified font instructions is created, the printed copy is identical to a printed copy of a document with no modified font print instructions, as the font modification can be made undetectable, or almost undetectable to the human eye. In other aspects, the method comprises: receiving an alleged copy of the electronic document with the modified font print instructions; and, comparing the modified font print instructions in the received document to the record.
